

Novel tricyclic spiroderivatives as modulators of
chemokine receptor activity

The present invention relates to novel compounds, processes for their preparation,
pharmaceutical compositions containing them and their use in therapy. In particular, the
5 invention relates to novel spirocyclic compounds, their preparation and use.

Chemokines play an important role in immune and inflammatory responses in various
diseases and disorders, including asthma and allergic diseases, as well as autoimmune
pathologies such as rheumatoid arthritis and atherosclerosis. These small secreted
10 molecules are a growing superfamily of 8-14 kDa proteins characterised by a conserved
four cysteine motif. The chemokine superfamily can be divided into two main groups
exhibiting characteristic structural motifs, the Cys-X-Cys (C-X-C) and Cys-Cys (C-C)
families. These are distinguished on the basis of a single amino acid insertion between the
NH-proximal pair of cysteine residues and sequence similarity.

15 The C-X-C chemokines include several potent chemoattractants and activators of
neutrophils such as interleukin-8 (IL-8) and neutrophil-activating peptide 2 (NAP-2).
The C-C chemokines include potent chemoattractants of monocytes and lymphocytes but
not neutrophils such as human monocyte chemotactic proteins 1-3 (MCP-1, MCP-2 and
20 MCP-3), RANTES (Regulated on Activation, Normal T Expressed and Secreted), eotaxin
and the macrophage inflammatory proteins 1 α and 1 β (MIP-1 α and MIP-1 β).

Studies have demonstrated that the actions of the chemokines are mediated by subfamilies
of G protein-coupled receptors, among which are the receptors designated CCR1, CCR2,
25 CCR2A, CCR2B, CCR3, CCR4, CCR5, CCR6, CCR7, CCR8, CCR9, CCR10, CXCR1,
CXCR2, CXCR3 and CXCR4. These receptors represent good targets for drug
development since agents which modulate these receptors would be useful in the treatment
of disorders and diseases such as those mentioned above.

30 Spiro(dihydrobenzofuran)piperidines and pyrrolidines having activity as analgesics and
tranquillising agents are described in US 4,166,119. Spiro(2,3-dihydrobenzofuran-2,4-

piperid-1-yl) derivatives of interest inter alia as antipsychotic and cerebral ischaemic agents are described in EP 0 351 282 B.

10 wherein R^1 , m , X , Y , R^2 , n , q , p , R^3 , R^4 and t are as defined for formula (I), with a compound of formula (VI)

wherein L is a leaving group (for example a methylsulphonyloxy group or nitrobenzenesulfonyloxy group) and R^5 is as defined for formula (I);

15 and optionally thereafter if necessary:

- (i) converting a compound of formula (I) into another compound of formula (I);
- (ii) removing any protecting groups; or
- (iii) forming a pharmaceutically acceptable salt or solvate.

20 The processes of the invention may conveniently be carried out in a solvent, e.g. an organic solvent such as an alcohol (e.g. methanol or ethanol), a hydrocarbon (e.g. toluene) or tetrahydrofuran, dimethylformamide, N-methylpyrrolidinone, dichloromethane or

acetonitrile at a temperature of, for example, 0°C or above such as a temperature in the range from 0, 5, 10, 15 or 20°C to 100, 110 or 120°C.

Conversion of a compound of formula (II) into a compound of formula (I) according to process (a) involves substituting the desired R³ substituent for the hydroxyl group shown in the formula. This may be performed using processes known in the art such as are illustrated in the examples. An amino group, for example, may be introduced by reacting the corresponding hydroxy derivative with di-tert-butyl imidocarbonate in the presence of suitable coupling reagents such as triphenylphosphine and diethyl azodicarboxylate, and a suitable solvent such as tetrahydrofuran.

Compounds of formulae (II), (III), and (IV), (V) and (VI) are either commercially available, are known in the literature or may be prepared using known techniques. Examples of preparation methods for certain of these compounds are given hereinafter in the examples.

Compounds of formula (II), where p is 1, may be prepared, for example, by reacting a compound of formula (VII)

wherein R¹, m, X, Y, R², n and q are as defined in formula (I), with a compound of formula (VII)

wherein R^3 and R^5 are as defined in formula (I), and t is 1 or 2

5 Compounds of formula (VII) and (VIII) are themselves either commercially available, are known in the literature or may be prepared using known techniques.

10 It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups such as hydroxyl or amino groups in the reagents may need to be protected by protecting groups. Thus, the preparation of the compounds of formula (I) may involve, at an appropriate stage, the removal of one or more protecting groups.

15 The protection and deprotection of functional groups is described in 'Protective Groups in Organic Chemistry', edited by J.W.F. McOmie, Plenum Press (1973) and 'Protective Groups in Organic Synthesis', 3rd edition, T.W. Greene and P.G.M. Wuts, Wiley-Interscience (1999).

20 The compounds of formula (I) above may be converted to a pharmaceutically acceptable salt or solvate thereof, preferably an acid addition salt such as a hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate, oxalate, methanesulphonate or *p*-toluenesulphonate.

25 Compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses the use of all geometric and optical isomers (including atropisomers) of the compounds of formula (I) and mixtures thereof including racemates. The use of tautomers and mixtures thereof also form an aspect of the present invention. Enantiomerically pure forms are particularly desired.

30 The compounds of formula (I) have activity as pharmaceuticals, in particular as modulators of chemokine receptor (especially MIP-1 α chemokine receptor) activity, and may be used

in the treatment of autoimmune, inflammatory, proliferative and hyperproliferative diseases and immunologically-mediated diseases including rejection of transplanted organs or tissues and Acquired Immunodeficiency Syndrome (AIDS).

THP-1 Chemotaxis Assay

Introduction

The assay measures the chemotactic response elicited by MIP-1 α chemokine in the human
5 monocytic cell line THP-1. Compounds are evaluated by their ability to depress the
chemotactic response to a standard concentration of MIP-1 α chemokine.

Methods

Culture of THP-1 cells

10 Cells are thawed rapidly at 37°C from frozen aliquots and resuspended in a 25 cm flask
containing 5 ml of RPMI-1640 medium supplemented with Glutamax and 10% heat
inactivated fetal calf serum without antibiotics (RPMI+10%HIFCS). At day 3 the medium
is discarded and replaced with fresh medium.

15 THP-1 cells are routinely cultured in RPMI-1640 medium supplemented with 10% heat
inactivated fetal calf serum and glutamax but without antibiotics. Optimal growth of the
cells requires that they are passaged every 3 days and that the minimum subculture density
is 4×10^5 cells/ml.

Chemotaxis assay

20 Cells are removed from the flask and washed by centrifugation in RPMI + 10%HIFCS +
glutamax. The cells are then resuspended at 2×10^7 cells/ml in fresh medium (RPMI +
10%HIFCS + glutamax) to which is added calcein-AM (5 μ l of stock solution to 1 ml to
give a final concentration of 5×10^{-6} M). After gentle mixing the cells are incubated at 37°C
25 in a CO₂ incubator for 30 minutes. The cells are then diluted to 50 ml with medium and
washed twice by centrifugation at 400xg. Labelled cells are then resuspended at a cell
concentration of 1×10^7 cells/ml and incubated with an equal volume of MIP-1 α antagonist
(10^{-10} M to 10^{-6} M final concentration) for 30 minutes at 37°C in a humidified CO₂
incubator.

Chemotaxis is performed using Neuroprobe 96-well chemotaxis plates employing 8 μ m filters (cat no. 101-8). Thirty microlitres of chemoattractant supplemented with various concentrations of antagonists or vehicle are added to the lower wells of the plate in triplicate. The filter is then carefully positioned on top and then 25 μ l of cells preincubated
5 with the corresponding concentration of antagonist or vehicle is added to the surface of the filter. The plate is then incubated for 2 hours at 37°C in a humidified CO₂ incubator. The cells remaining on the surface are then removed by adsorption and the whole plate is centrifuged at 2000 rpm for 10 minutes. The filter is then removed and the cells that have migrated to the lower wells are quantified by the fluorescence of cell associated calcein-
10 AM. Cell migration is then expressed in fluorescence units after subtraction of the reagent blank and values are standardized to % migration by comparing the fluorescence values with that of a known number of labelled cells. The effect of antagonists is calculated as % inhibition when the number of migrated cells is compared with vehicle.
